Solution

1/. D. All of the mentioned

2/. C. zero

3/. A. Hamming Distance

4/. C. Both A+B

5/. ~~D. Linear regression~~ A : Decision tree

6/. ~~A. Vote~~ B : Bagging

7/. ~~A. zero~~ B : one

8/. ~~B. Pie chart~~ D : Scatter plot

9/. ~~A. Lines~~ D : point

10/. B. Mean

11/. B. a real Number

12/. C. Feature Selection

13/. B. Regression

14/. C. time series

15/. B. Logoistic regression

16/. C. Parameter of the Ml algorithm (model variable)

17/. A. True

18/. D. Non-diagonal element

19/. A. TP / (TP + FN)

20/. ~~C. Margin points~~ B

21/. Supervised Learning is the machine Learning that we training with Labelled dataset and print the output base on dataset that have been trained.

23/. Regression analysis: is the algorithm that analyze the ~~reo~~ relationship of Variable or element.

28/. Data pre-processing is the process that we use to clean the dataset to make sure dataset doesn't have null value in any column and tranform data to a form that can understood by computer.

29/. Because, we want to scalling the huge data to small data, So we can cover the Smaller ~~rang~~. rank.

31/. K in K-means algorithm is the number of Cluster that we used to categories the data.

34/. Comment on the performance of the classifiers:

1. The first classifiers: is a better classifiers but not perfect yet, ~~becas~~ because the Line is nearly fit to the data points. So it can effect to accuracy.

2. The ~~secod~~ second classifiers: is the bad one because, ~~the~~ some data point is in the support Vectors ... algorithm can't classifiers data properly.

34.1 Continuous

3. The ~~$~~ third classifiers is the perfect peformance in of this ~~ttt~~ three classifiers. Because. the support vectors can classifiers data properly and the space between line and data is better. This algorithm can have more accuracy in theis classifiers.

30/. The continuous attributes are ~~de~~discretized is:

- Represented by number
-
-

~~27/. To find the outlier in data-set:~~

- ~~Check tha classifiers the dataset.~~
- ~~check the long distance value~~
-

25/. List out any two major application of data Science:

1. Health care sector : use to analyze th diseas of patient.
2. Ecomerce application
   use to analyze the user interest and etc.

27/. To find an outliers in the data

- use statistic method : to measure data
- ~~D~~ distance based method: use distance ~~mat~~ metrics.
- Density based method: Identify data point that ~~b~~ Low density in ~~rego~~ region.
- Cluster based method: identify data point belong to data not in any cluster
