21. Supervised Learning is a process providing the Input data as well as the correct output data to the Training data set in machine Learning model.

23. Regression analysis is a machine learning Technique use to predict the discrete value in the dataset. $\{1, 0\}$, $\{\text{spam}, \text{no spam}\}$.

24. Two Challenges of Machine Learning :

- Hard to collecting the dataset and use the data to do the processing and make the data cleansing. Challenges to manage the dataset in machine learning process.
- Can't give the 100% correct output and have a problem to analyze the output.

25. List out any two major application of data science

- Healthcare application : help to analyze the health care system.
- Finance application : help in the Finance system.

26. Distinguish between the terms : structure data and Semi-structure data

+ structure data : data with a high degrees of organization and easy to understand

+ Semi-structure data : data with some degrees of organizational.

31. K in K-means algorithms mean the number of cluster
If $K=2$, It mean have 2 cluster, If $K=3$ It mean It has 3 cluster, and so on.

29. Data normalization is required in K-NN because in Data normalization need K-NN algorithm to do the process in Data normalization and it help Data normalization to make the data easy to do the process.

28. Data pre-processing is a process we are collecting the data, prepare data in the dataset, prepare the dataset for the data training in Machine Learning algorithms.

32. Name few hyperparameters of machine learning algorithm

- Nearest Neighbor
- Naive Baye
- KNN
- Linear regression
- Support Vector machine (SVM)
- Neural Networks
- K-mean - clustering
- Association Rules
- Q - Learning.
- Temporal Difference (TD).

22. A model may give 99% of accuracy for training dataset and give 30% of accuracy for testing dataset. When the training data set the machine applies the machine learning algorithms and it makes the accuracy of training data set is 99%. When doing the data testing there is not yet applied the machine learning algorithm that's why in testing data have only 30% of accuracy.

27. To find outlier in the data we need to do the processing

using outlier techniques in machine learning algorithm:

- Detection: Detect the data in the data set.
- Imputation: Find the outlier data in data set.

30. The continuous attributes are discretized is because the value of the data in the data set are in the quantitative data and it can compress in a number and all the data are can compress in the number.
