21. Supervised learning is use to predict the out come by providing data to be train and test. Example: Linear regression, naive bayes, K nearest-N.
25. Two major application on data science are finance, health care.
26. Structured data ~~are~~ ^{is a} type of data that are well label like CSV, JSON.
- ~~26. Semi-Structured data~~ ^{is a} type of data that is partially label.
27. To find out an Outlier in data we can use visualization technique like Scatter plot or Box plot and with another methods.
28. Data pre processing is a ~~type of data that are~~ way to processing and cleaning data.
24. Elucidate is a way to calculate the distance in KNN. Example:
29. Data normalization is required because imbalance data can affect the result.
31. K in K-means algorithm stand for K.
32. Some hyperparameters of machine learning algorithms:
- epoch
23. Regression analysis is way to analys the output of the prediction in regression problem.

30). Continuous attribute can be discretized by

35). Radial Basis ~~function~~ kernel in SVM

28). Model M1 might pick the wrong algorithm for training or the way of evaluation is not correct, and it could be the ^{in-balance} of data without doing normalization or ~~good~~ the right feature selection.
