

MCQ

24

9

1. D

2. B

3. D

4. B

5. A

6. B

7. B

8. A

9. C

10. B

11. B

12. C

13. B

14. C

15. B

16. C

17. A

18. D

19. A

20. B

Answer all questions

21. Supervised Learning is has a label, relationship and dependences between prediction target of input and output.
27. Find out an outlier in the data
- + trimming/removing outlier
 - + quantile based on flooring and capping
 - + mean/median imputation
28. Data pre-processing is process that first we collecting data, cleaning, modeling and implement.
29. Data normalization is required in K-NN because its can scaling that data so that it can represent in the smaller range and it can test fast.
31. K in k-means algorithm is represent the number of variable in group and should choose from 1 to 10.
23. Regression analysis is an analysis on continuous values.
34. Comment on the performance of the classifiers.
- + first SVM classifier: the two ^{line} is a little bit closer to the variable but the gap between the line is 'good'.
 - + second SVM classifier: it is not good because the variable has inside the gap of the two line.
 - + third SVM classifier: the gap from the two line to the variable is good but the two line is too close to each other.

22. Comment on model M1.

A model M1 give 99% of accuracy for training but give 30% of accuracy for testing so it's mean the testing dataset is not accurate enough even though training get the highest percentage.

24. Elucidate any two challenges of ML.

- + Some distance is not accurate
- + Slow

25. List out any two major applications of data science.

- + Finance
- + Infrastructure

26. Distinguish between Structured and Semi-Structured data

- + Structured data is high level
- + Semi-structured data is low level

30. Continuous attributes are discretized by converted float or String to Integer.

33. Gradient descent is a multiple descent.

32. Name few hyperparameters of ML

- Converted variable
- check null value
- train
- test

- test
 - train
 - check with value
 - counted variable
37. Name few hyperparameters of ML
38. Gradient descent is a multiple descent
- to improve.

39. Features are attributes are characterized by numerical and categorical data
- categorical data is low level
 - structured data is high level
40. Relationship between structured and unstructured data
- Infrastructure
 - Feature

41. But can you find major applications of data science
- slow
 - some features are not accurate

42. Elucidate why the challenges of ML

43. Comment on model ML

44. A model ML give set of answers for training but give wrong answers for testing as it's never the testing dataset. It's not accurate enough to understand the logic of machine learning.
