- 21) Supervised learning is the process of observation labeled Data. Data that fall into the same category.
- 22) Based on the result that we've got, the percentage result of testing dataset seemed not to meet the expectation. The accuracy is so low and the gap between training dataset and testing dataset is too far.
- 23) Regression analysis is the study of real number such as number prediction and future data prediction.
- 24) Two challenges of Machine Learning are: some dataset might have null value that need to be optimize. And the lack of existed dataset to study.
- 25) Two major applications of Data Science are: Panda and Matplotlib.
- 26) Different between structured and semi-structured data:
↳ Structured Data: data that is well organized and can be read as (1,0). Included: Image, Video, File, Voice Message
↳ Semi-Structured Data: is the data that can be written as HTML or JSON or XML.
- 27) We can find an outlier in the data by the different rate ^{of} that data. The data that fall into another category from the other or has different type.
- 28) Data pre-processing is the the process of go through the data before training with it. To check if there is any null value that can be optimize before further processing.
