II.

②1. Supervised learning is the modern language of algorithm model that already know output & input but, giving to input to machine and ~~give~~ predict the output and keep going until get high level of the output.

②3. Regression analysis is the process of machine learning that are trying to understand, learning, analyzing the relationship of data.

②7. We can use outlier detection.

②9. Data normalization is require in k-NN because it is process of preparatⁿ in which help organize the difficult to understand data into normal scale.

21. Supervised learning is the machine learning algorithm model that already has output & input but giving to input to machine and give predict the output and keep going until get high level of the output.
22. Regression analysis is the process of machine learning that are trying to understand, learning, analyzing the relationship of data.
23. Data normalization is required in K-NN because it is process of preparing it which help organize the difficult to understand data into normal scale.
24. We can use outlier detection.
