21. Supervised learning is to make the machine to do what we target it to do.
For Example:   we have a label for every sign so machine will learn by knowing its label.

23. Regression analysis is for prediction and forecasting. there are 2 values in it which are independence and dependence value or we can call it as input and output.

29. data normalization is required for KNN because.
1. to get the categories output (0, 1) from KNN.
2. and it will understand and can make the data to scale.

28. Data preprocessing is the way to clean and make or prepare data before using and it has many steps.
- Data Cleansing
- Data transform
- Data
-

33. Gradient descent is an optimization algorithm which is commonly used to train machine learning and Neural Network.

24. the two challenge in Machine learning are.

- It hard to make the Machine to learn. what we want it to learn
- take too ~~much time~~. much time

22. Model M_1 have 94% of Accuracy which is give an highest linear regression that to predict. and for the other 30% it really not good for the testing data set.

25. Two major application of data science

- Linear regression
- Logistic regression

35. Radial Basis function kernel work ~~really~~ by finding the right thing to ~~sup~~ support and ~~the~~ making the good Classification and also the distance.
