⑲. B

⑳. C

②4. Identify the performance of classifiers.

+ The first picture

It's the good classifiers because the linear boundaries are separate the data into 2 parts and with the well space between and don't face any challenges while separating the data.

+ The ~~p~~ second picture

It's not really good classifiers because there's a few challenges in it but for the space is good which is it's not really close to each other.

+ The third picture

The both lines is too close to each other and in SVM we don't recommend to have smaller space between each other like this even it doesn't have any challenges, but it's not the good classifier among the 3.

②1. Supervised Learning is the type of algorithm which is we need ~~the~~ to train the dataset in order to do the prediction of the ~~va~~ labeled.

②9. In KNN ~~wh~~ we required the data normalization because in KNN we don't need to train the dataset because it's a lazy learner, so they just predict the data ~~to know~~ and using the ~~k~~ neighbor value.

③①. k in k -means algorithm is the number of clusters that we want to have while we clustering the data.

③②. The continuous attributes are discretized, by
↳ it is numerable ~~value~~ value
↳ countable
↳ can divide into subdivision into small pieces.

③③. We can find the outlier in the Data by checking that thoes data are in the same group of it or not.

③④. Distingursh between the terms: structured and Semi-Structured data

structured data

- easy to analyze
- easy to understand the structure
- "

semi-structured data

- combination of structured and unstructured.
- not in order
- hard to any analyzed.

③⑤. Since $M1$ gives 99% of accuracy for training data-set and it gives 30% of accuracy for testing dataset which mean that this model $M1$ ~~need~~ is supervised learning and it takes more ~~#~~ times and cost on ~~training~~ training process and testing.

Q5. List out ^{any} two major applications of data science

- Healthcare

-

Q2. Name few hyperparameters of Machine learning algorithm

↳ regression

↳ ~~etc~~ K-means clustering

↳ Classification.

Q3. Regression analysis is the technique that we use to predict the output of the variable.
