27. Outlier detection is the process of separating odd the data in order to improve the accuracy of model and decreases the unnecessary scale of data. ①

21. Supervised learning is when a given model data are labeled.

It's being used to improve the accuracy of the ML based on the existing input. EX: Image, Text.

25. Two major applications of Data Science

- Weather forecasting : by analysing the previous weather data we can predict and prepare for the upcoming weather.
- Stock price prediction : by learning about the stock price pattern over time we can predict the stock price in the future and join into the market on the right time.

26. Structured Data

- all the data is labeled
- all data have its corresponding data type
- ready to used as ML model

Semi structured Data

- all the data is not categorized yet
- still have null or missing value
- not efficient for training yet.

28. Data pre processing is the process of getting rid of unusable data such null value, cleansing and normalizing the data in other to make the model much more efficient for training.

31. k in k-means represent the number of data point.

24. challenges of ML: Data Collection and training the model.
