21. Supervised learning is an algorithm that we use to classify the data that contains label.

23. Regression analysis is a method that we use for search data and then grouping the data and identifying the data.

25. two major applications of data science = Mobile Bank application and Netflix.

28. Data pre-processing is the process for collecting the data source before going to analysts.

29. ~~Data~~ Data normalization is required in k-NN because normalization help to scale all the same data for easier to analysis so that k-NN easy for classification.

31. k is a range for does the classify the data in k-means algorithm mean that k-means algorithm do the process based on k.

32. Some few hyperparameters of machine learning algorithms is the best hyperline to make different between classes.

~~22. based on mind the M1 need to do the classification matrix to find~~
~~a~~

29. based on mind the M1 model is not yet the best solution yet since it has only 30% accuracy the data set should use another model then do classification matrix to find the best one.

24. Elucidate any two challenges of machine learning =

- Linear regression

- logistic regression

27. to find the outlier in the data we need to use

26. Structured data is the data that contains in row and column.

Semi-structured data is the data ~~that we know~~ like language letters, etc.

34. based on mind I thought the bellow was :

the first and last are classify clear but the middle is not clear.
