21. Supervised Learning is a technique that we used data that trained for training dataset and for testing dataset.

22. Comment on model M1 : model M1 gives 99% of accuracy for training dataset it means the number of accuracy of M1 model has high percentage of success. Model M1 gives 30% of accuracy for testing dataset it means M1 model for testing is not enough to become a good model and need more time of training.

23. Regression analysis is a process of analysing set of data to enhance training dataset and testing dataset that which used Linear Regression.

24. Elucidate any two challenges of Machine Learning.
- model training : as it using ~~AI~~ dataset for training so it needed us to train model to get more accuracy.

24. Time Consumption : to make a model to come more accuracy and get successful it might take very long time and more Effort.

25. List out any two major applications of data science :

1. Stock price prediction
2. Number of Orders prediction

26. Distinguish between terms : structured and semi-structured data :

<u>structured</u>	<u>semi-structured</u>
- data well organized - Tson, Excel, Spreadsheet - convenience for developer to use for building application - in a specific format that allow us to use for any purpose - easy to manage for training purposes	- data is not well organized - Audio, music - for developer it needs time and effort if consider to use semi-structured data. - it may take time if want to use it as training dataset.

27. We find out outlier

32. Name few hyperparameters of machine learning algorithms.

~~1. Learning rate~~ 1. Learning rate

~~2. Momentum~~ 2. Momentum

27. We find out outlier in the data by using virtualization technique and calculate the distance.

25. Data pre-processing is the way of converting raw data into useful data for utilizing purposes.

33. Gradient descent is an unsupervised learning for prediction data.

31. k in k -means algorithm is class.

29. Data normalization is required in k -NN because it has big data and need to minimize.
