21. Supervised learning is an algorithm that required both input and output to train the model. It acts like a teacher, the teacher give question and then the answer. Then the model start to learn the pattern and predict or give the output.

22. Model M1 give 99% for training set and 30% for testing set. In my opinion the way that they split the data is inefficient. the dataset should be 80/20 and should be used by random to ensure the data is right for best for training and testing.
25. Major Application of data science :
- Health care
 - Economic
27. we found outlier by ~~using~~ analysing the data, it always be the abnormal data amongst the majority of data. we can use ~~virtue~~ Virtualization, statistic, anomynal, plot.
28. Data pre-processing is a process of gathering data, clean it, fill the missing value, and make sure the data is correct and usable for training the model.
29. Normalization is required in K-NN because we want to limit the range of value of data between 0 and 1, so it is easier and more efficient when we find nearest points, and give high accuracy
31. The K in k-mean algorithms is number of points.
33. Regression analysis is process of studying the classified output
24. Two challenges of machine learning :
- Data ~~pe~~ pre-processing
 - Choosing the right algorithms for the model

26. Structured data is data that has been prepared properly in CSV or excel sheet.
Semi-structured data is a little messy of data than structured data ~~for~~ that
are normally in format HTML, etc.

are normally in form of HTML, etc.

Some structured data is a little messy at first but structured data for that
Structured data is data that has been prepared properly in CSV or excel sheet
