2. challenges of ML

18) 

19) 

20) D
K is user specified parameter.

21) supervised learning is used to model relationship and dependencies between the target ~~per~~ prediction output and input features. Based on the relationship of previous dataset, we can ~~find~~ predict new values.

23) Data Science is used in Finance and Healthcare industry.

27) To find an outlier in data, we can use:

- statistical method (z-score)
- Distance based method
- Density based method
- clustering based method
- classification based method
- Neural Network based method

28) Data pre-processing is a phase where we transform data into format that can be understood by computer.

29) Because we want to scale the value of ^{the} variable to be similar.

33) Gradient Descent is used to find coefficient.

32) max depth tree, min depth tree and can be used for data analysis.

26) structured data is well structured and can understand
It includes csv files, db ---
Semi-structured need to transform to structured data.
It includes json file, XML ---

18) C

19) B

24 2 challenges of ML
- work with huge dataset
